Tue 26 Apr. 13:40S5/6 14:05 Wed 27 Apr. 11:30 15:15 Thu 28 Apr. 11:45 15:25 Fri 29 Apr. 11:50 15:30 Sat 30 Apr. 12:10 15:40 Sun 31 Apr. 11:10 15:50 Sun 1 May 11:30 15:10 Sun 2 May 11:35 15:15 there must be some mistake in my calculations. Does this what I think? A: Remember that the X coordinate represents the angle between the vector from the light source and the line that is perpendicular to the screen (in your case the line between the centre of the screen and the viewer). This means that when the vector is pointing down, the "angle" of the vector relative to the screen is 90 degrees, and when the vector is pointing right, the angle is 0. Since your vector has an angle of 90 degrees relative to the direction you want to measure, your angle should be 90 degrees - theta - 45 degrees. This means that the tangent of theta is negative, so you should use tan(-theta), not tan(theta). Also remember that the sign of theta is positive, which means that you're trying to find the time when the angle between the direction of the light and the direction you want to measure is negative (i.e. when the vector is pointing down) and that therefore tan(-theta) is negative, so tan(theta) is positive. Q: ExtJS 4 Sencha Architect not loading store.js? We are working on an existing project in which we were using ExtJS 3.4. We recently started work on the next major release of the product (ExtJS 4) and encountered a strange behavior when using Sencha Architect to generate the project. It's generating the project files and it's working fine except for the fact that it's not generating the store.js file that's needed to connect to the back end database. Ext.require(['Ext.data.*', 'Ext.panel.*', 'Ext.layout.container.Table']); Ext.onReady(function () { Ext.define('Entry', { extend: 'Ext.data.Model', 82157476af
